

# Library Dependency Issues

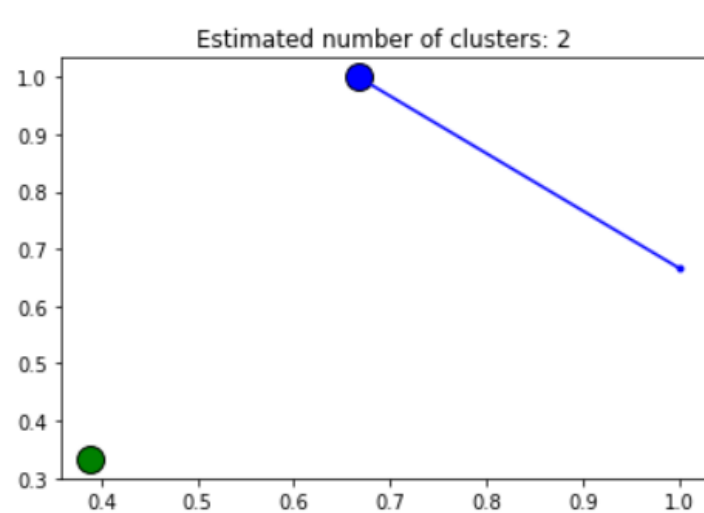

## An Study on Software Library Upgrade Dependency Issues

Student: Nicholas Yeo Ming Jie    Supervisor: Asst. Prof. Li Yi

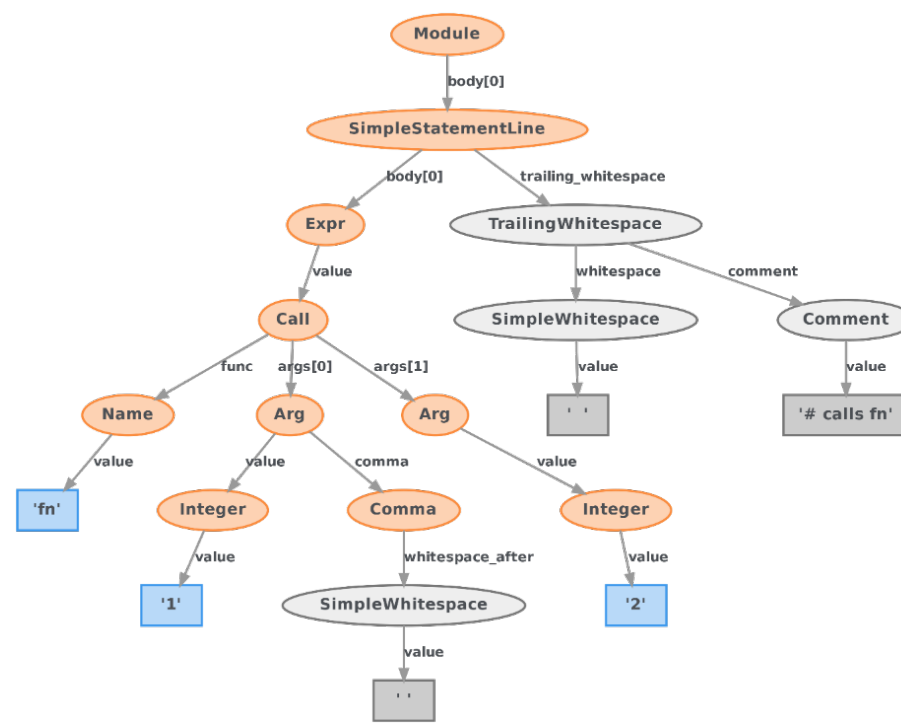

Method Invocation: tf.nn.relu

Similarity Matrix:

	0	1	2
0	1.000000	0.666667	0.388889
1	0.666667	1.000000	0.333333
2	0.388889	0.333333	1.000000

Labels:  
[0 0 1]

Targeted Method Invocation	f1()
Call Sequence	f3(), f4(), f1(), f2(), f1(), f2(), f5()
Pre-set	f2(), f3(), f4()
Accompany-set	f2()
Post-set	f2(), f5()

### Project Objectives:

It is a standard practice for developers to “re-use” code written by third parties. These codes are tools provided by third-party software libraries. The reliance on these third-party software libraries is growing, causing the number of vulnerabilities found in software systems that incorporate them to increase. Third-party software libraries used in software systems are regarded as sources of vulnerabilities as they can be exploited by attackers. Moreover, compatibility issues between third-party software libraries and the software systems that utilizes them arises due to asynchronous updates and negligence of developers. This study will be proposing a method to detect these vulnerabilities. In addition, there will be a discussion on the level of third-party library dependency issues or how much software systems in the market are dependent on third party software libraries and the effort needed to detect, prevent, or mitigate these issues.

### Approach:

1. Preparation of Data Analysis Tool
2. Identifying Method Invocations
3. Identifying Call Sequences
4. Identifying Usage Patterns
5. Identifying Sequence Clusters
