Joint PhD Program Description

The description for the Joint PhD program will be posted online as a sub-page to

Joint PhD Programmes | Graduate College | NTU Singapore.

Name of Partner University	Shanghai Jiao Tong University	
Country	China	
Year of JPP Establishment	2022	
Program	☑ Joint Degree☐ Joint Supervision	
Description of the Program (150-250 words)	The NTU-SJTU joint PhD degree program is newly launched in 2022 to provide students with an excellent opportunity to study in an interdisciplinary, international and multicultural environment. Areas of research include Science, Engineering, Management, Computing and Social Sciences. Students are expected to fulfil a residency or period of attachment between a minimum of 12 months to a	
Disciplines	maximum of 24 months at the Partner Institution. All disciplines, but not limited to carbon utilization and sustainability, e.g., chemistry, chemical engineering, material science, environmental science and engineering, human-computer interaction, brain-computer interfaces, computer vision, visual analytics, medical computing, artificial intelligence, chemical biology, immunology, and microbiology.	
PMC Names	NTU: K Jimmy Hsia, Liu Hong SJTU: Deng Tao, Xuemin (Lisa) Xu	
PMC Emails	NTU: kjhsia@ntu.edu.sg; liuhong@ntu.edu.sg SJTU: dengtao@sjtu.edu.cn; lisaxu@sjtu.edu.cn	

Joint Projects

1.	Similarity Search on High-Dimensional Vector Data	3
2.	Efficient Edge Intelligent Computing	4
3.	Any-to-Any Large Multimodal Models	5
4.	Adaptation of LLM for ASR for under-resource languages	6
5.	Accelerating Dynamic Graph Embedding on GPU	7
6.	Enhancing Intelligent Marketing via Graph Models	9
7.	Vector Database Systems and its Applications in LLMs	10
8.	Deep learning assisted protein binding affinity prediction: towards next generation design using generative models	_
9.	Low-speed Tidal Energy Harvesting through Oscillating Hydrofoils	14
10.	Trustworthy Artificial Intelligence for Foundation Models	15
11.	Developing Low-Frequency Metamaterials for Wireless Power Transfer Systems	17
12.	Chemical Transformation of Waste Carbon Resources to Value-added Products	19
13.	Impact of the Gut Microbiota on Host Gut Biology	20

1. Similarity Search on High-Dimensional Vector Data

Date Posted	15 July 2024

Website	https://personal.ntu.edu.sg/liu/	https://english.seiee.sjtu.edu.cn/english/detail/2128_1921.htm
Project Description (200-300 words)	The project is to explore the deployment of state-of-the-art AI technologies on the edge devices. It addresses the challenge of the increasing gap between the rapidly growing model size and the limited computing capabilities under tight processor, memory and power constraints. The targeted applications include the latest vision transformers and large language models, and the targeted hardware includes embedded CPUs/GPUs and customized AI accelerators of various types. The project will explore model design and optimization, hardware-software co-design, and energy-efficient computing techniques. The expected outcome is to be transformative to bring AI capabilities to lightweight devices without or with limited cloud support in diverse industry domains. Candidates interested in the joint programme are advised to contact either Dr. Weichen Liu (NTU, liu@ntu.edu.sg) or Dr. Yaoyao Ye (SJTU, yeyaoyao@sjtu.edu.cn) for more details on the project as well as admission requirements.

Project Description (200-300 words)	Large multimodal models (LMMs) have achieved substantial progress with the emergence of ChatGPT, GPT4-V and Sora. Yet, existing LMMs only focus on vision and language, neglecting other useful multimodal sensory inputs such as audio, speech and 3D information. This project aims to develop a new paradigm of generative AI, any-to-any large multimodal models (LMMs) that can comprehend, associate and integrate the rich information from multiple modalities in a holistic manner. Developing such a new paradigm of any-to-any LMMs requires the study of 1) novel theory on cross-modal information fusion, and 2) efficient design on neural network architecture. The outputs of this project would possess both scientific merit as well as industrial impact.

Email	aseschng@ntu.edu.sg	chenxie95@sjtu.edu.cn
Website	https://aseschng.github.io/de fault.html	https://chenxie95.github.io/
Project Description (200-300 words)	In this research, we will examine how to adapt LLM for ASR speech recognition for under-resourced languages. One promising research direction is to apply strong pre-trained self-supervised speech representations to reduce speech training data. Additionally, we propose to explore text-only target language supervision by converting text to ARPA (pronunciation token) and enable LLM to learn new languages with minimal speech/text training data. This approach is akin to using text to speech (TTS) to generate target speech. That is, if we can train a single text to speech for the target language, then we can generate large variations of target speech from multiple speaker through text by having SOTA generative TTS approaches which dis-entangle context to speaker characteristics.

School	Chemistry, Chemical Engineering and Biotechnology	Institute of Natural Sciences
Email	r.ni@ntu.edu.sg	hwu81@sjtu.edu.cn
Website	https://www3.ntu.edu.sg/home/r.ni	https://ins.sjtu.edu.cn/peoples/wuhao
Project Description (200-300 words)	The quest for accelerated drug discovery has intensified the need for innovative computational methods that can predict protein-ligand interactions with high accuracy. Traditional computational approaches, such as molecular dynamics and Monte-Carlo simulations, are often hindered by their inefficiencies in exploring the vast, high-dimensional energy landscapes of multibody systems. These methods typically become trapped in local minima or require the construction of low-dimensional reaction coordinates, limiting their effectiveness in complex, multidimensional spaces without extensive expert input.	
	In response to these challenges, our recent advancements have leveraged flow-based generative models to effectively sample the Boltzmann distribution and transition path distribution of molecular systems, achieving significant breakthroughs in the field. Building upon these successes, this project will further innovate by using deep learning to approximate energy fields, enhancing the sampling process without relying on predefined reaction coordinates. This approach integrates state-of-the-art techniques such as reinforcement learning, adversarial learning, and diffusion models to overcome typical shortcomings of deep learning models, such as missing critical conformational regions and over-reliance on pre-training. Additionally, the project will develop automated analysis methods to identify and interpret critical states such as metastable and transition states, utilizing graph neural networks to convert enhanced sampling data into accurate kinetic models. This comprehensive methodology aims to improve the efficiency and precision of modeling drug molecule interactions in complex multibody systems. The resulting method will be used to predict the binding affinity of proteins with small molecules and to accurately analyze the	

	binding process, thereby offering a paradigm-shifting approach for next-generation drug discovery.
	Candidates interested in the joint program are advised to contact either the SJTU (Dr Hao Wu, hww81@situ.edu.cn) or NTU (Dr Ran Ni, r.ni@ntu.edu.sg) supervisors for additional information on the project as well as admission requirements.

future.	00-300 words)	Metamaterials are artificial materials with negative permittivity and/or permeability that have not been founded in natural counterparts. The concept of metamaterial was initially proposed by J. B. Pendry in 1990s. Since then, high-frequency metamaterials have been extensively investigated and applied in the fields of electromagnetics, mechanics, and optics over the last two decades. Metamaterials consist of multiple unit cells with the same structure that are periodically arranged in a space to mimic the lattice structure in crystals. For high-frequency electromagnetic metamaterials, each unit cell comprise the inductances formed by the conductors and the stray capacitances formed between the conductors. The inductances and capacitances are in resonance at specific frequencies, thereby inducing large conductor currents which further strengthen the external magnetic fields. However, existing high-frequency metamaterials cannot be used for low-frequency (from power frequency to megahertz) high-power (>200W) electromagnetic devices, because of some technical bottlenecks. The objective of this project is to develop the unit cells of low-frequency metamaterials with negative magnetic resistances to

Website	https://personal.ntu.edu.sg/wenliu/	https://lcc.sjtu.edu.cn/En/Data/View/1097
Project Description (200-300 words)	Global warming is the greatest existential challenge of the present century. As part of the effort to mitigate global warming, the transition from conventional fossil-fuel based value chains to renewable and sustainable value chains is essential. To this end, this program aims for cutting-edge research on the utilisation of waste carbon resources (CO ₂ , biomass, etc.) to produce value-added functional products high potential for impact. Targeting at renewable fuels, chemicals and materials transformed from renewable, abundant and widely-available waste carbon resources, the program is dedicated to mitigating the carbon footprints and negative environmental impacts of the chemical industry, as well as to enhance the economic competitiveness of waste carbon valorisation processes through novel catalyst development and reaction design towards commercial viability. Candidates interested in the joint program are advised to contact either the SJTU (Dr Xi Chen, chenxilice@sjtu.edu.cn) or NTU (Dr Wen Liu, wenliu@ntu.edu.sg) supervisors for additional information on the project as well as admission requirements.

School	School of Chemistry, Chemical Engineering and Biotechnology	School of Life Sciences and Biotechnology	
Email	yuan.qiao@ntu.edu.sg	zehan.hu@sjtu.edu.cn	
Website	www.yqiaolab.com	https://life.sjtu.edu.cn/teacher/huzehan	
Project Description (200-300 words)	The Qiao lab (NTU) and Hu lab (SJTU) jointly explore the impact of gut microbiota composition and metabolites on host gut immunology. While numerous studies have demonstrated the essential roles of the gut microbiota on human health, the detailed mechanistic understanding of how the gut microbiota affects host health at the molecular level is far from clear. To answer such complex questions, the two labs will join forces to build a multidisciplinary program, where the Qiao lab focuses on the analytical and chemical microbiology aspects to elucidate the structures and develop chemical probes of the gut microbiota metabolites, and the Hu lab has expertise on gut immunology and animal models. The joint projects will elucidate mechanisms of gut microbiota metabolites on host gut immunology and function from both in vitro and in vivo aspects. The candidate will apply analytical chemistry and synthetic chemistry to study the gut microbiota-derived metabolites (Qiao lab), and specifically address the bioactivity and signalling pathways of such metabolites in vitro and in vivo in mice models (Qiao and Hu lab). The candidate will receive holistic training in chemical microbiology and immunology areas and have opportunities to work closely with both teams.
