

Joanna A. Ellis-Monaghan & Iain Moffatt

***Handbook of the Tutte
polynomial and related
topics***

Contents

Preface	xvi
Contributors	xvii
I Fundamentals	17
1 Graph theory	20
<i>Joanna A. Ellis-Monaghan • Iain Moffatt</i>	
1.1 Introduction	20
1.2 Graph theory conventions	20
2 The Tutte polynomial for graphs	31
<i>Joanna A. Ellis-Monaghan • Iain Moffatt</i>	
2.1 Introduction	31
2.2 The standard definitions of the Tutte polynomial	32
2.3 Multiplicativity	41
2.4 Universality of the Tutte polynomial	41
2.5 Duality	43
2.6 Open problems	44
3 Essential properties of the Tutte polynomial	45
<i>Béla Bollobás • Oliver Riordan</i>	
3.1 Introduction	46
3.2 Evaluations at special points	46
3.3 Coefficient properties and irreducibility	50
3.4 Evaluations along curves	52
3.5 Dual graphs and medial graphs	54
3.6 Knots	57
3.7 Signed, colored and topological Tutte polynomials	60
3.8 Open problems	61
4 Why matroids?	62
<i>James Oxley</i>	
4.1 Introduction	62
4.2 Fundamental examples and definitions	63
4.3 The many faces of a matroid	69

4.4	Duality	72
4.5	Basic constructions	78
4.6	More examples	88
4.7	The Tutte polynomial of a matroid	91
4.8	Some particular evaluations	99
4.9	Some basic identities	103
5	Tutte polynomial activities	104
	<i>Spencer Backman</i>	
5.1	Introduction	104
5.2	Activities for maximal spanning forests	105
5.3	Activity bipartition	106
5.4	Activities for subgraphs	107
5.5	Depth-first search external activity	108
5.6	Activities via combinatorial maps	109
5.7	Unified activities for subgraphs via decision trees	111
5.8	Orientation activities	112
5.9	Active orders	114
5.10	Shellability and activity	115
5.11	Open problems	117
6	Tutte uniqueness and Tutte equivalence	118
	<i>Joseph E. Bonin • Anna de Mier</i>	
6.1	Introduction	118
6.2	Basic notions and results, and initial examples	119
6.3	Tutte uniqueness and equivalence for graphs	126
6.4	Tutte uniqueness and equivalence for matroids	134
6.5	Related results	151
6.6	Open problems	155
II	Computation	157
7	Computational techniques	160
	<i>Criel Merino</i>	
7.1	Introduction	160
7.2	Direct computation	161
7.3	Duality and matroid operations	164
7.4	Using equivalent polynomials	166
7.5	Transfer matrix method	170
7.6	Decomposition	172
7.7	Counting arguments	175
7.8	Other strategies	177
7.9	Computation for common graphs and matroids	178
7.10	Open problems	178

8 Computational resources	180
<i>David Pearce • Gordon F. Royle</i>	
8.1 Introduction	180
8.2 Implementations	181
8.3 Comparative performance	189
8.4 Conclusions	191
8.5 Open problems	192
9 The exact complexity of the Tutte polynomial	194
<i>Tomer Kotek • Johann A. Makowsky</i>	
9.1 Introduction	194
9.2 Complexity classes and graph width	195
9.3 Exact evaluations on graphs	198
9.4 Exact evaluation on matroids	203
9.5 Algebraic models of computation	209
9.6 Open problems	211
10 Approximating the Tutte polynomial	213
<i>Magnus Bordewich</i>	
10.1 Introduction	213
10.2 Notation	215
10.3 Randomized approximation schemes	215
10.4 Positive approximation results	218
10.5 Negative results: inapproximability	222
10.6 The quantum connection	227
10.7 Open problems	228
III Specialisations	229
11 Foundations of the chromatic polynomial	232
<i>Fengming Dong • Khee Meng Koh</i>	
11.1 Introduction	232
11.2 Computing chromatic polynomials	233
11.3 Properties of chromatic polynomials	239
11.4 Chromatically equivalent graphs	251
11.5 Roots of chromatic polynomials	259
11.6 Open problems	266
12 Flows and colorings	271
<i>Delia Garijo • Andrew Goodall • Jaroslav Nešetřil</i>	
12.1 Introduction	271
12.2 Flows and the flow polynomial	272
12.3 Coloring-flow convolution formulas	276
12.4 A-bicycles	280
12.5 Open problems	282

13 Skein polynomials and the Tutte polynomial when $x = y$ 285*Joanna A. Ellis-Monaghan • Iain Moffatt*

13.1	Introduction	285
13.2	Vertex states, graph states, and skein relations	286
13.3	Skein polynomials	288
13.4	Evaluations of the Tutte polynomial along $x = y$	299
13.5	Open problems	301

14 The interlace polynomial and the Tutte–Martin polynomial 302*Robert Brijder • Hendrik Jan Hoogeboom*

14.1	Introduction	302
14.2	Notation	303
14.3	Interlace polynomial	304
14.4	Martin polynomial	308
14.5	Global interlace polynomial	310
14.6	Two-variable interlace polynomial	312
14.7	Weighted interlace polynomial	313
14.8	Connection with the Tutte polynomial	314
14.9	Isotropic systems and the Tutte–Martin polynomial	315
14.10	Interlace polynomials for delta-matroids	317
14.11	Summary	321
14.12	Open problems	321

IV Applications 323**15 Network reliability 326***Jason I. Brown • Charles J. Colbourn*

15.1	Introduction	327
15.2	Forms of the reliability polynomial	328
15.3	Calculating coefficients	332
15.4	Transformations	334
15.5	Coefficient inequalities	335
15.6	Analytic properties of reliability	339
15.7	Open problems	343

16 Codes 346*Thomas Britz • Peter J. Cameron*

16.1	Introduction	346
16.2	Linear codes and the Tutte polynomial	347
16.3	Ordered tuples and subcodes	352
16.4	Equivalence of the Tutte polynomial and weights	355
16.5	Orbital polynomials	356
16.6	Other generalizations and applications	357
16.7	Wei’s duality theorem	359
16.8	Open problems	361

17 Chip-firing game and sandpile model	363
<i>Criel Merino</i>	
17.1 Introduction	363
17.2 The Tutte polynomial and the chip-firing game	364
17.3 Sandpile models	366
17.4 The critical group and parking functions	367
17.5 Open problems	369
18 The Tutte polynomial and knot theory	370
<i>Stephen Huggett</i>	
18.1 Introduction	370
18.2 Graphs and links	371
18.3 Polynomial invariants of links	373
18.4 The Tutte and Jones polynomials	375
18.5 The Tutte and HOMFLYPT polynomials	377
18.6 Applications in knot theory	378
18.7 The Bollobás–Riordan polynomial	379
18.8 Categorification	382
18.9 Open problems	384
19 Quantum field theory connections	385
<i>Adrian Tanasa</i>	
19.1 Introduction	385
19.2 The Symanzik polynomial as evaluations of the multivariate Tutte polynomial	386
19.3 The Symanzik polynomials in quantum field theory	387
19.4 Hopf algebras and the Tutte polynomial	392
19.5 Open problems	394
20 The Potts and random-cluster models	395
<i>Geoffrey Grimmett</i>	
20.1 Introduction	395
20.2 Probabilistic models from physics	396
20.3 Phase transition	402
20.4 Basic properties of random-cluster measures	403
20.5 The Limit as $q \downarrow 0$	404
20.6 Flow polynomial	407
20.7 The limit of zero temperature	409
20.8 The random-cluster model on the complete graph	409
20.9 Open problems	411
21 Where Tutte and Holant meet: A view from counting complexity	412
<i>Jin-Yi Cai • Tyson Williams</i>	
21.1 Introduction	412

21.2	Definition of Holant and related concepts	413
21.3	Specializations of the Tutte polynomial with local expressions	415
21.4	Open problems	420
22	Polynomials and graph homomorphisms	422
	<i>Delia Garijo • Andrew Goodall • Jaroslav Nešetřil • Guus Regts</i>	
22.1	Introduction	422
22.2	Homomorphism profiles	424
22.3	Edge coloring models	427
22.4	Connection matrices	429
22.5	Matroid invariants	431
22.6	Graph polynomials from homomorphism profiles	432
22.7	Graph polynomials by recurrence formulas	434
22.8	Open problems	438
V	Extensions	441
23	Digraph analogues of the Tutte polynomial	444
	<i>Timothy Y. Chow</i>	
23.1	Introduction	444
23.2	The cover polynomial	445
23.3	Tutte invariants for alternating dimaps	452
23.4	Gordon–Traldi polynomials	455
23.5	The B -polynomial	458
23.6	Open problems	458
24	Multivariable, parameterized, and colored extensions of the Tutte polynomial	459
	<i>Lorenzo Traldi</i>	
24.1	Introduction	459
24.2	Parameterized and multivariate Tutte polynomials	460
24.3	Identities for parameterized Tutte polynomials	464
24.4	Related parameterized polynomials	468
24.5	Four parameters: Colored and strong extensions	472
24.6	Ported polynomials, and others	477
24.7	Open problems	478
25	Zeros of the Tutte polynomial	480
	<i>Bill Jackson</i>	
25.1	Introduction	480
25.2	The multivariate Tutte polynomial	481
25.3	Zero-free regions in \mathbb{R}^2	483
25.4	Density of real zeros	486
25.5	Determining the sign of the Tutte polynomial	489
25.6	Complex zeros	489

25.7	Open problems	491
26	The U, V and W polynomials	492
	<i>Steven Noble</i>	
26.1	Introduction	492
26.2	Properties of the polynomials	496
26.3	Equivalent polynomials and symmetric functions	505
26.4	Graphs determined by their U -polynomial	510
26.5	Complexity issues	511
26.6	Related polynomials	513
26.7	Open problems	514
27	Topological extensions of the Tutte polynomial	516
	<i>Sergei Chmutov</i>	
27.1	Introduction	516
27.2	Ribbon graphs.	518
27.3	The Bollobás–Riordan polynomial.	520
27.4	The Las Vergnas polynomial.	521
27.5	The Krushkal polynomial.	522
27.6	Polynomials from deletion–contraction relations	525
27.7	Polynomials arising from flows and tensions	528
27.8	Quasi-trees	528
27.9	Open problems	532
28	The Tutte polynomial of matroid perspectives	533
	<i>Emeric Gioan</i>	
28.1	Introduction	534
28.2	Matroid perspectives	534
28.3	The Tutte polynomial of a matroid perspective	535
28.4	Deletion–contraction and Möbius function constructions	538
28.5	Subset activities in matroids and perspectives	539
28.6	Five-variable expansion and partial derivatives	542
28.7	Representable and binary cases	543
28.8	Brief accounts of related polynomials	546
28.9	Open problems	549
29	Tutte polynomials of hyperplane arrangements and the finite field method	551
	<i>Federico Ardila</i>	
29.1	Introduction	551
29.2	Hyperplane arrangements	552
29.3	Polynomial invariants	555
29.4	Topological and algebraic invariants	557
29.5	The finite field method	560
29.6	A catalog of characteristic and Tutte polynomials	562

29.7	Multivariate and arithmetic Tutte polynomials	566
29.8	Open problems	569
30	Some algebraic structures related to the Tutte polynomial	570
	<i>Michael J. Falk • Joseph P.S. Kung</i>	
30.1	Introduction	570
30.2	Orlik–Solomon algebras	571
30.3	Coalgebras associated with matroids	581
30.4	Open problems	582
31	The Tutte polynomial of oriented matroids	584
	<i>Emeric Gioan</i>	
31.1	Introduction	585
31.2	Oriented matroids and related structures	585
31.3	Tutte polynomial in terms of orientation-activities	591
31.4	Counting bounded regions and bipolar orientations	593
31.5	Generalizations to oriented matroid perspectives	595
31.6	Activity classes and active partitions	596
31.7	Filtrations and β -invariants	599
31.8	The active basis	601
31.9	Reorientations/subsets bijection, refined orientation-activities	604
31.10	Counting circuit/cocircuit reversal classes	607
31.11	Open problems	608
32	Valuative invariants on matroid basis polytopes	610
	<i>Michael J. Falk • Joseph P.S. Kung</i>	
32.1	Introduction	610
32.2	Valuative functions on matroid base polytopes	611
32.3	Open problems	617
33	Non-matroidal generalizations	618
	<i>Gary Gordon • Elizabeth McMahon</i>	
33.1	Introduction	618
33.2	Greedoids and the Tutte polynomial	621
33.3	Antimatroids	628
33.4	The β -invariant	636
33.5	Open problems	639
VI	History	641
34	The history of Tutte–Whitney polynomials	644
	<i>Graham Farr</i>	
34.1	Introduction	644
34.2	The classic papers	646
34.3	Preliminaries	648

34.4	Notation in the papers	651
34.5	Whitney, 1932: A logical expansion in mathematics	652
34.6	Whitney, 1932: The coloring of graphs	653
34.7	Whitney, 1933: Topological invariants for graphs	659
34.8	Tutte, 1947: A ring in graph theory	660
34.9	Tutte's PhD thesis	668
34.10	Tutte, 1954: A contribution to the theory of chromatic polynomials	670
34.11	Tutte, 1967: On dichromatic polynomials	673
34.12	Potts, 1952: Some generalized order-disorder transformations	678
34.13	Zykov	680
34.14	Some other work	681
34.15	Closing remarks	683
	Acknowledgements	691
	Bibliography	692
	Selected evaluations and interpretations	772
	Symbols	781
	Index	789
